No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence 49,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                        activity, isolated from nematodes, are useful to inhibit blood coagulation. The proteins can be added to blood collection tubes defining the collection of mammalian plasma. They are also useful to prevent or inhibit thrombosis, and may be given alone or in combination with other therapeutic or in vivo diagnostic agents. The proteins can serve as immunosens to raise antibodies for use in the diagnosis and identification of NAP concn. levels in biological fulds, e.g. to detect mammalian infection with a parasitic worm. They can also be used as immunosens in prophylactic and therapeutic vaccines against parasitic worm infection. The proteins may when present at 10-50 mWol, and double the clotting time of human plasma in prothrombin time assays when present at 10-100 nMol.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                      The anticoagulant proteins are pref. derived from Ancylostoma caninum, A. ceylanicum, A. duodenale, Necator americanus or Heligomosmoides polygyrus.

The proteins pref. have 2 NAP domains and specifically inhibit the catalytic activity of the factor VIIa/TF complex in the presence of factor Xa or a catalytically inactive factor Xa deriv., do not specifically inhibit the activation of factor VIIa in the absence of TF and do not specifically inhibit prothrombinase.

Proteins given in AAR91720-R91732 are preferred subsequences
                                           Proteins with anticoagulant and/or serine protease inhibitory activity - isolated from nematodes and useful to inhibit blood
                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Nematode extracted anticoagulant protein; NAP; anticoagulant; serine protease inhibitor; NAP domain; factor VIIa/TF.

The present sequence represents a nematode extracted anticoagulant protein (NAP) fragment. The protein has activity as an anticoagulant and/or serine protease inhibitor: The protein contains at least one and an anticoagulant and/or serine protease inhibitory activity for factor VIIa/Te Packening an isolated protein at least one domain for factor VIIa/Te selective inhibitory activity. The method comprises determining the time to clotting effected by a concentration of the isolated protein in an ex vivo prothrombin time (PT) assay and an ex vivo activated partial thromobolastin time (aPTT) assay; calculating prolongation of clotting effected by the isolated protein in each of the PT and aPTT assay, with respect to a baseline clotting value for each assay, where prolongation of clotting is calculated as fold elevation of clotting time relative to a baseline clotting value, where a doubling of clotting time relative to a baseline clotting and actuating a PT to aPTT prolongation ratio, where a cratic at least one is indicative of factor VIIa/TF inhibitory activity. The method is useful for determining if a protein has factor VIIa/TF inhibitory activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Nematode-extracted anticoagulant protein; NAP domain; blood clotting; canine hookworm; thrombosis; vaccine.
                                                                                                                                                                                                                                                                                                                                                                                              Screening an isolated protein for Nematode-extracted Anticoagulant

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                    The present sequence is a fragment of the NAP domain (see AAB15347), which is found in all nematode-extracted anticoagulant proteins (NAPS). Proteins of this kind have been shown to be effective at preventing blood clotting without causing excessive bleeding. They can be used in blood collection tubes to aid the isolation of plasma from the blood, to prevent thrombosis which may be linked to the rupture of an atheroscientic plaque, acute myocardial infarction, angina, thrombolytic therapy, percutenneous transluminal coronary angioplasty, disseminated intravascular coagulopathy, infection, cancer and septic shock, and to produce antibodies. In the latter instance, the antibodies can be raised in order to detect infection by nematodes (the coding sequences can also be used for this) or as diagnostic tests. The proteins can also be used as vaccines against nematode parasites.
                                                                                                                                                                                                                                                                                                                                                                       Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Proteins with anticoagulant and/or serine protease inhibitory activity, isolated from nematodes, are useful to inhibit blood cogqulation. The proteins can be added to blood collection tubes defining the collection of mammalian plasma. They are also useful to prevent or inhibit thrombosis, and may be given alone or in combination with other therapeutic or in vivo diagnostic agents. The proteins can serve as immunogens to raise antibodies for use in the diagnosis and identification of NAP concn. levels in biological fluids, e.g. to detect mammalian infection with a parasitic worm. They can also be used as immunogens in prophylactic and therapeutic vaccines against parasitic worm infection. The proteins may double the clotting time of human plasma in prothrombin time assays when present at 10-50 nMol, and double the clotting time of human plasma in prothrombin time of human and also human assays when present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The anticoagulant proteins are pref. derived from Ancylostoma caninum, A. ceylanicum, A. duodenale, Necator americanus or Heligomosmoides polygyrus.

The proteins pref. have 2 NAP domains and specifically inhibit the catalytic activity of the factor VIIa/TF complex in the presence of factor Xa or a catalytically inactive factor Xa deriv, do not specifically inhibit the activation of factor VIIa in the absence of TF and do not specifically inhibit prothrombinase.

Proteins given in AAR91720-R91732 are preferred subsequences
                                                                                                                                                                                                                                                                                                                                                                                                                                 Proteins with anticoagulant and/or serine protease inhibitory activity - isolated from nematodes and useful to inhibit blood
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ;

```
The present sequence is a fragment of the NAP domain (see AAB15347), which is found in all nematode-extracted anticoagulant proteins (NAPs). Proteins of this kind have been shown to be effective at preventing blood clotting without causing excessive bleeding. They can be used in blood collection tubes to aid the isolation of plasma from the blood, to prevent thrombosis which may be linked to the rupture of an atheroscierotic plaque, acute myocardial infarction, angina, thrombolytic therapy, percutaneous transluminal coronary angioplasty, disseminated intravascular coagulopathy, infection, cancer and septic shock, and to produce antibodies. In the latter instance, the antibodies can be raised in order to detect infection by nematodes (the coding sequences can also be used for this) or as disgnostic tests. The proteins can also be used for this lor as disagnostic tests. The proteins can also be used for this lor as disagnostic tests. The proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                          Stanssens PEH, Jespers LS, Gansemans YGJ, Moyle M; ssens JHL, LaRoche YR, Vlasuk GP;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present sequence represents a nematode extracted anticoagulant protein (NAP) fragment. The protein has activity as an anticoagulant and/or serine protease inhibitor. The protein contains at least one and/or selective inhibitory activity for factor VIIa/TE. The specification describes a method for screening an isolated protein at least one domain for factor VIIa/TE selective inhibitory activity. The method comprises determining the time to clotting effected by a concentration of the isolated protein in an ex vivo prothrombin time (PT) assay and an ex vivo activated partial thromboplastin time (aPTT) assay, calculating prolongation of clotting effected by the isolated protein in each of the PT and aPTT assay, with respect to a baseline clotting value for each assay, where prolongation of clotting is calculated as fold elevation of clotting time relative to a baseline clotting value, where a doubling of clotting time relative to a baseline clotting the least one is indicative of factor VIIa/TF inhibitory activity. The method is useful for determining if a protein has factor VIIa/TF inhibitory activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö

```
nematode-extracted anticoagulant proteins AcaNAP21, AcaNAP42 and AcaNAP46. Proteins of this kind have been shown to be effective at preventing blood clotting without causing excessive bleeding. The proteins can be used in blood collection tubes to aid the isolation of plasma from the blood, to prevent thrombosis which may be linked to the rupture of an atherosclerotic plaque, acute myocardial infarction, angina, thrombolytic therapy, percutaneous transluminal coronary angioplasty, disseminated intravascular coagulopathy, infection, cancer and septic shock, and to produce antibodies. In the latter instance, the antibodies can be raised in order to detect infection by nematodes (the coding sequence can also be used for this) or as diagnostic tests. The proteins can also be used as a vaccine against nematode parasites.
                                                                                                                                                                                                                                                                               PEH, Jespers LS, Gansemans YGJ, Moyle M;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present sequence represents a nematode extracted anticoagulant correct protein (NAP). The protein has activity as an anticoagulant and/or serine protein (NAP). The protein contains at least one NAP domain which has selective inhibitory activity for factor VIIa/TF. The specification correctibes a method for screening an isolated protein at least one domain for for factor VIIa/TF selective inhibitory activity. The method comprises determining the time to clotting effected by a concentration of the isolated protein in an ex vivo prothrombin time (PT) assay and an ex vivo activated partial thromboplastin time (PT) assay; calculating prolongation of clotting effected by the isolated protein in each of the PT and apTT assay, with respect to a baseline clotting value for each assay, where prolongation of clotting is calculated as fold elevation of clotting time relative to a baseline clotting value, where a doubling of clotting time is deemed a two-fold elevation; and calculating apT to apTT prolongation ratio, where a ratio at least cone is indicative of factor VIIa/TF inhibitory activity. The method is useful for determining if a protein has factor VIIa/TF inhibitory
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö

                                                                                                                                                                                                                                                                                                                                                                                                                                protein (NAP). The protein has activity as an anticoagulant and/or serine protein (NAP). The protein has activity as an anticoagulant and/or serine protease inhibitor. The protein contains at least one NAP domain which has selective inhibitory activity for factor VIIa/TP. The specification for for factor VIIa/TP selective inhibitory activity. The method comprises cateraining the time to clotting effected by a concentration of the isolated protein in an ex vivo protrombin time (PT) assay and an ex vivo activated partial thromboplastin time (aPTT) assay; calculating prolongation of clotting effected by the isolated protein in each of the act assay, with respect to a baseline clotting value for each assay, where prolongation of clotting is calculated as fold elevation of clotting time relative to a baseline clotting value, where a doubling of clotting time relative to a baseline clotting value, where calculating a TP to apTT prolongation ratio, where a ratio at least one is indicative of factor VIIa/TF inhibitory activity. The method is useful for determining if a protein has factor VIIa/TF inhibitory
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö

protein (NAP). The protein has activity as an anticoagulant and/or serine protein chibitor. The protein contains at least one NAP domain which case inhibitory activity for factor VIIa/TF. The specification describes a method for screening an isolated protein at least one domain for factor VIIa/TF. The specification for factor VIIa/TF. The specification of case factor vita/TF. The method comprises determining the time to clotting effected by a concentration of the isolated protein in an ex vivo prothrombin time (PT) assay and an ex vivo activated partial thromboplastin time (aPT) assay; calculating to prolongation of clotting effected by the isolated protein in each of prolongation of clotting effected by the isolated protein in each of case assay, where prolongation of clotting is calculated as fold elevation of clotting time relative to a baseline clotting value, where a doubling of clotting time is deemed a two-fold elevation; and calculating a PT to aPTT prolongation there a ratio at least cone is indicative of factor VIIa/TF inhibitory activity. The method is useful for determining if a protein has factor VIIa/TF inhibitory
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Nematode-extracted anticoagulant protein; AceNAP4d2; blood clotting; canine hookworm; thrombosis; vaccine.

    A. ceylanicum nematode-extracted anticoagulant protein AceNAP4d2 #1.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Screening an isolated protein for Nematode-extracted Anticoagulant
Protein domains

The present sequence is the Ancyclostoma ceylanicum nematode-extracted anticoagulant protein AceNAP4d2. Proteins of this kind have been shown to be effective at preventing blood clotting without causing excessive bleeding. The protein can be used in blood collection tubes to aid the isolation of plasma from the blood, to prevent thrombosis which may be linked to the rupture of an atherosclerotic plaque, acute myocardial infarction, angina, thrombolytic therapy, percutaneous transluminal coronary angioplasty, disseminated intravascular coagulopathy, infection, cancer and septic shock, and to produce antibodies. In the latter instance, the antibodies can be raised in order to detect infection by meatodes or as diagnostic tests. The protein can also be used as a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present sequence is the Ancyclostoma ceylanicum nematode-extracted anticoagulant protein AceNAP4d2. Proteins of this kind have been shown to be effective at preventing blood clotting without causing excessive bleeding. The protein can be used in blood collection tubes to aid the isolation of plasma from the blood, to prevent thrombosis which may be linked to the rupture of an atherosclerotic plaque, acute mycoardial infarction, angina, thrombolytic therapy, percutaneous transluminal coronary angioplasty, disseminated intravascular coagulopathy, infection, cancer and septic shock, and to produce antibodies. In the latter instance, the antibodies can be raised in order to detect infection by nematodes or as diagnostic tests. The protein can also be used as a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                8
                                                                        The present sequence represents a nematode extracted anticoagulant protein (NAP). The protein has activity as an anticoagulant and/or serine proteins expectation to protease inhibitor. The protein contains at least one NAP domain which has selective inhibitory activity for factor VIIa/TF. The specification describes a method for screening an isolated protein at least one domain for factor VIIa/TF selective inhibitory activity. The method comprises for factor VIIa/TF selective inhibitory activity. The method comprises for factor VIIa/TF selective inhibitory activity. The method comprises cativated protein in an ex vivo prothrombin time (PT) assay and an ex vivo activated partial thromboplastin time (aPTT) assay; calculating activity and aptra assay, where prolongation of clotting is calculated as fold elevation of clotting time relative to a baseline clotting value for each assay, where prolongation of clotting is calculated as fold elevation; and calculating a PT to aPTT prolongation ratio, where a ratio at least one is indicative of factor VIIa/TF inhibitory activity. The method is useful for determining if a protein has factor VIIa/TF inhibitory
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Screening an isolated protein for Nematode-extracted Anticoagulant Protein domains

The present sequence represents a nematode extracted anticoagulant protein has activity as an anticoagulant and/or serine protein has activity as an anticoagulant and/or serine protease Inhibitor. The protein contains at least one MAP domain which has selective inhibitory activity for factor VIIa/TF. The specification describes a method for screening an isolated protein at least one domain for factor VIIa/TF selective inhibitory activity. The method comprises determining the time to clotting effected by a concentration of the solated protein in an ex vivo prothrombin time (PT) assay and an ex vivo activated partial thromboplastin time (PT) assay and an ex vivo prolongation of clotting effected by the isolated protein in each of the PT and aPTT assay, with respect to a baseline clotting value for each assay, where prolongation of clotting is calculated as fold clavation of clotting time relative to a baseline clotting value, where a doubling of clotting time relative to a baseline clotting value, where calculating a PT to aPTT prolongation ratio, where a ratio at least one is indicative of factor VIIa/TF inhibitory activity. The method is useful for determining if a protein has factor VIIa/TF inhibitory
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence
```

Disclosure; Columns 135-138; 197pp; English.

The present sequence represents a nematode extracted anticoagularic protein (NAP). The protein has activity as an anticoagulant and/or serine protein (NAP). The protein contains at least one NAP domain which has selective inhibitory activity for factor VIIa/TF. The specification describes a method for screening an isolated protein at least one domain confidence of the first selective inhibitory activity. The method comprises determining the time to clotting effected by a concentration of the isolated protein in an ex vivo prothrombin time (PT) assay and an ex vivo activated partial thromboplastin time (aPTT) assay; calculating activated partial thromboplastin time (aPTT) assay, and an ex vivo prothrombin time (PT) assay, and an ex vivo prothrombin selecting value for each assay, where prolongation of clotting is calculated as fold elevation of clotting time relative to a baseline clotting value, where a doubling of clotting time relative to a baseline clotting value, where calculating a PT to aPTT prolongation ratio, where a ratio at least one is indicative of factor VIIa/TF inhibitory activity. The method is concein the concein has factor VIIa/TF inhibitory

Li Submitted (AFR-2001) to the EMBL/GenBank/DBJ databases.

C-1- FUNCTION: HAS BOTH AN APURINIC AND/OR APYRIMIDINIC ENDONUCLEASE ACTIVITY. INCISES DAWAGED DNA AT CYTOSINES, THYMINES AND GUANINES. ACTS ON A DAWAGED STRAND, 5' FROM THE DAWAGED SITE (BY SIMILARITY).

C-1- CATALYTIC ACTIVITY: The C-0-P bond 3' to the apurinic or apyrimidinic site in DNA is broken by a beta-elimination reaction, leaving a 3'-terminal unsaturated sugar and a product with a criminal 5'-phosphare.

C-1- COPACTOR: BINDS A FE-4S CLUSTER WHICH IS NOT IMPORTANT FOR THE CATALYTIC ACTIVITY, BUT WHICH IS PROBABLY INVOLVED IN THE PROPER POSITIONING OF THE BNZYME ALONG THE DNA STRAND (BY SIMILARITY).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Fleischmann R.D., Alland D., Bisen J.A., Carpenter L., White O., Peterson J., DeBoy R., Dodson R., Gwinn M.L., Haft D., Hickey E., Kolonay J.P., Nelson W.C., Umayam L.A., Ermolaeva M.D., Salzberg S.L., Delcher A., Utterback T., Weidman J., Khouri H., Gill J., Mikula A., Bishai W.;

"An alternative splicing modifies the C-terminal end of tryptophanyl-tRNA syntherase in murine embryonic stem cells.";
J. Mol. Biol. 242:599-603(1994).
-!-CATALYTIC ACTIVITY: ATP + L-tryptophan + tRNA(Trp) = AMP +
diphosphate + L-tryptophanyl-tRNA(Trp).
-!-SUBUNIT: Homodimer (By similarity).
                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Name=1; Synonyms=Long;

Name=2; Synonyms=Short;
Isodd=P32921-2; Sequence=VSP 006313;
-1-TISSUE SPECIFICITY: Isoform 2 is widely expressed, isoform 1 is found only in embryonic atem cells.
-1-SIMILARITY: Belongs to class-1 aminoacyl-tRNA synthetase family.
-1-SIMILARITY: Contains 1 WHEP-TRS domain.
                                                                                                                                                                                                                                                              01-0CT-1993 (Rel. 27, Created)

Ruether U., Schuetz G.;
Ruether U., Schuetz G.;
Reacte of the albino phenotype by introduction of a functional
tyrosinase gene into mice.";
EMBO J. 9:2819-2826(1990).
-!- FUNCTION: THIS IS A COPPER-CONTAINING OXIDASE THAT FUNCTIONS IN
THE PORMATION OF PIGMENTS SUCH AS MELANINS AND OTHER POLYPHENOLIC
COMPOUNDS. GATALYZES THE RATE-LIMITING CONVERSIONS OF TYROSINE TO
DOPA, DOPA TO DOPA-QUINONE AND POSSIBLY 5,6-DIHYDROXXINDOLE TO
INDOLE-5,6 QUINONE.
-!- CARLALYZE ACTIVITY: L-tyrosine + L-DOPA + O(2) = L-DOPA +
                                                                                                                                                                                                                                                                                                                                                     DOPAQUINONE + H(2)O.

COACTOOR: Binds 2 copper ions per subunit.

SUBCELLULAR LOCATION: Type I membrane protein. Melanosomal.

DISEASE: DEFECTS IN TYR RESULT IN VARIOUS FORMS OF ALBINISM.

HIMALAYAN STRAIN TYROSINASE IS TEMPERATURE-SENSITIVE.

SIMILARITY: BELONGS TO THE TYROSINASE FAMILY.

CAUTION: REP.4 SEQUENCE WAS INCORRECT DUE TO A DELETION OF EXON 3.
